

EQUIPMENT INVENTORY

Because NFPA 70B follows an assessment-based approach, maintenance schedules depend on each asset's condition, criticality, and operating environment. An accurate electrical equipment inventory is the essential first step in meeting these requirements and building a compliant program.

ELECTRICAL MAINTENANCE PROGRAM (EMP)

Once your electrical equipment has been assessed, our team will develop a customized plan of action for your facility. This plan becomes your documented Electrical Maintenance Program (EMP), which outlines the inspections and maintenance required to meet NFPA 70B. Our team performs the work outlined in the EMP and conducts regular audits to support ongoing compliance.

DOCUMENTATION & COMPLIANCE

NFPA 70B requires more than performing maintenance. It also mandates complete documentation of training, test results, equipment condition data, and maintenance intervals. Our team delivers clear, organized reports and can incorporate additional information such as warranties and equipment details for long-term recordkeeping.

THE VALUE OF NFPA 70B

Preventative maintenance is no longer optional. The latest NFPA 70B updates make routine electrical system maintenance a requirement. These changes are intended to reduce electrical failures, improve safety, and ensure long-term system reliability.

A compliant NFPA 70B program can lower insurance premiums, reduce costly downtime, and limit liability risks for your facility. Having a trusted partner with decades of testing and maintenance experience can make these standards easier to manage while giving you confidence in the strength of your program.

OUR SERVICES INCLUDE:

- Comprehensive electrical equipment inventory
- EMP development, implementation, and auditing
- Arc-flash hazard analysis
- Infrared inspections
- Employee electrical safety training support
- Electrical testing, rebuilding, and repair services
- Short-circuit and protective device coordination studies
- Reporting, documentation, and compliance support
